

# **CSE 411: Artificial Intelligence (Elective Course #6)**

**400 Level, Mechatronics Engineering  
2<sup>nd</sup> Term 2016/2017, Lecture #6**

**Hazem Shehata**

Dept. of Computer & Systems Engineering  
Zagazig University

**April 3<sup>rd</sup>, 2017**

Credits to Dr. Mohamed El Abd for the slides

# Adminstrivia

## Notes

- Assignment #2:
  - Due on **Thursday**.

## Course Info:

- Website: <http://hshehata.github.io/courses/zu/cse411/>
- Office hours: Sunday 11:30am - 12:30pm

# Adminstrivia

## Notes

- Assignment #2:
  - Due on **Thursday**.
- Assignment #3:
  - Released Today.
  - Due on **Sunday, April 16, 2017**.

## Course Info:

- Website: <http://hshehata.github.io/courses/zu/cse411/>
- Office hours: Sunday 11:30am - 12:30pm

### Requirements & Reading Material

## 1 Adversarial Search

## 2 Requirements & Reading Material

# Adversarial search

## Introduction

- Multi-agent environments:
  - Cooperative.
  - Competitive.

# Adversarial search

## Introduction

- Multi-agent environments:
  - Cooperative.
  - Competitive.
- In competitive environments, different agents have conflicting goals.

# Adversarial search

## Introduction

- Multi-agent environments:
  - Cooperative.
  - Competitive.
- In competitive environments, different agents have conflicting goals.
- This gives rise to ***adversarial search***, also known as ***games***.

# Adversarial search

## Introduction

- In games, other agents:
  - Want our agent to lose.
  - Introduce uncertainty, don't know what will they do.

# Adversarial search

## Introduction

- In games, other agents:
  - Want our agent to lose.
  - Introduce uncertainty, don't know what will they do.
- The unpredictability of other agents can introduce many possible ***contingencies***.

# Adversarial search

## Introduction

- In games, other agents:
  - Want our agent to lose.
  - Introduce uncertainty, don't know what will they do.
- The unpredictability of other agents can introduce many possible ***contingencies***.
- We will consider a specific type:
  - Deterministic.
  - Fully observable.
  - Two agents with alternating actions.

Outline

Adversarial  
Search

Introduction

Minimax Algorithm

$\alpha$ - $\beta$  Pruning

Requirements  
& Reading  
Material

# Adversarial search

	deterministic	chance
perfect information	chess, checkers, go, othello	backgammon monopoly
imperfect information	battleships, blind tictactoe	bridge, poker, scrabble nuclear war

# Adversarial search

## Introduction

- The main problem with games is that the search space is too huge:
  - A search tree for chess has an average branching factor of 35.
  - An average chess game lasts for 50 moves per player.
  - The average search tree has  $35^{100}$  nodes.

# Adversarial search

## Introduction

- The main problem with games is that the search space is too huge:
  - A search tree for chess has an average branching factor of 35.
  - An average chess game lasts for 50 moves per player.
  - The average search tree has  $35^{100}$  nodes.
- There is not enough time to search the whole tree and calculate the exact consequences of every move.

# Adversarial search

## Introduction

- The main problem with games is that the search space is too huge:
  - A search tree for chess has an average branching factor of 35.
  - An average chess game lasts for 50 moves per player.
  - The average search tree has  $35^{100}$  nodes.
- There is not enough time to search the whole tree and calculate the exact consequences of every move.
- If the optimal decision is not feasible (due to time or memory constraints), some decision has to be taken.

# Adversarial search

## Introduction

We will investigate:

- What is an optimal move and how to find it.

# Adversarial search

## Introduction

We will investigate:

- What is an optimal move and how to find it.
- Pruning the search tree.

# Adversarial search

## Introduction

We will investigate:

- What is an optimal move and how to find it.
- Pruning the search tree.
- How to choose a good move when time is limited.

# Adversarial search

## Introduction

We will investigate:

- What is an optimal move and how to find it.
- Pruning the search tree.
- How to choose a good move when time is limited.
- How to define a heuristic evaluation function to approximate the utility of a state.

# Adversarial search

## Minimax Algorithm

- First thing to consider is how to make an optimal move.

### Outline

#### Adversarial Search

Introduction

**Minimax Algorithm**

$\alpha$ - $\beta$  Pruning

#### Requirements & Reading Material

# Adversarial search

## Minimax Algorithm

- First thing to consider is how to make an optimal move.
- Certain assumptions exist:
  - A two player game.
  - The play is sequential (agents taking turns).
  - The opponent is playing perfectly.

# Adversarial search

## Minimax Algorithm

- First thing to consider is how to make an optimal move.
- Certain assumptions exist:
  - A two player game.
  - The play is sequential (agents taking turns).
  - The opponent is playing perfectly.
- The two players are referred to as **MAX** and **MIN**:
  - **MAX** wants to maximize the utility.
  - **MIN** wants to minimize the utility.

### Outline

A partial game tree for the game of tic-tac-toe:

### Outline

### Adversarial Search

Introduction

Minimax Algorithm

$\alpha$ - $\beta$  Pruning

### Requirements & Reading Material

# Adversarial search

## Minimax Algorithm

- **MAX** is the first player to move, starting at the root node.

# Adversarial search

## Minimax Algorithm

- **MAX** is the first player to move, starting at the root node.
- The utility values at the leaf nodes are from **MAX's** point of view.

# Adversarial search

## Minimax Algorithm

- **MAX** is the first player to move, starting at the root node.
- The utility values at the leaf nodes are from **MAX's** point of view.
- The optimal strategy is found by examining the ***minimax value*** of each node.

# Adversarial search

## Minimax Algorithm

- In a normal search tree, a solution is to find a path from initial state to goal state (*i.e.*, a winning state for **MAX**).

# Adversarial search

## Minimax Algorithm

- In a normal search tree, a solution is to find a path from initial state to goal state (*i.e.*, a winning state for **MAX**).
- However, since **MIN** affects the search, a contingent strategy should be found.

# Adversarial search

## Minimax Algorithm

- In a normal search tree, a solution is to find a path from initial state to goal state (*i.e.*, a winning state for **MAX**).
- However, since **MIN** affects the search, a contingent strategy should be found.
- The strategy defines:
  - **MAX's** move at the initial state.
  - **MAX's** move at all states generated by all possible moves by **MIN**.
  - ... and so on.

# Adversarial search

## Minimax Algorithm

- In a normal search tree, a solution is to find a path from initial state to goal state (*i.e.*, a winning state for **MAX**).
- However, since **MIN** affects the search, a contingent strategy should be found.
- The strategy defines:
  - **MAX's** move at the initial state.
  - **MAX's** move at all states generated by all possible moves by **MIN**.
  - ... and so on.
- This means that **MAX** needs a winning strategy independent of what **MIN** does.

### Outline

#### Adversarial Search

Introduction

Minimax Algorithm

$\alpha$ - $\beta$  Pruning

#### Requirements & Reading Material

# Adversarial search

## Minimax Algorithm

- **MAX** will choose a move that maximizes its utility value.

### Outline

#### Adversarial Search

Introduction

**Minimax Algorithm**

$\alpha$ - $\beta$  Pruning

#### Requirements & Reading Material

# Adversarial search

## Minimax Algorithm

- **MAX** will choose a move that maximizes its utility value.
- **MIN** will choose a move that minimizes the utility value of **MAX**.

# Adversarial search

## Minimax Algorithm

- **MAX** will choose a move that maximizes its utility value.
- **MIN** will choose a move that minimizes the utility value of **MAX**.
- This results in **MAX** (at the root) choosing its best move given available information.

### Outline

#### Adversarial Search

Introduction

Minimax Algorithm

$\alpha$ - $\beta$  Pruning

#### Requirements & Reading Material

# Adversarial search

## Minimax Algorithm

- **MAX** will choose a move that maximizes its utility value.
- **MIN** will choose a move that minimizes the utility value of **MAX**.
- This results in **MAX** (at the root) choosing its best move given available information.
- Available information is via look ahead (the search down the tree).

### Outline

#### Adversarial Search

Introduction

Minimax Algorithm

$\alpha$ - $\beta$  Pruning

#### Requirements & Reading Material

# Adversarial search

## Minimax Algorithm

- The minimax value of a node is defined as follows:

$$\text{MINIMAX}(s) = \begin{cases} \text{UTILITY}(s) & \text{if } \text{TERMINAL-TEST}(s) \\ \max_{a \in \text{ACTIONS}(s)} \text{MINIMAX}(\text{RESULT}(s, a)) & \text{if } \text{PLAYER}(s) = \text{MAX} \\ \min_{a \in \text{ACTIONS}(s)} \text{MINIMAX}(\text{RESULT}(s, a)) & \text{if } \text{PLAYER}(s) = \text{MIN} \end{cases}$$

## Adversarial Search

- Introduction
- Minimax Algorithm
- $\alpha$ - $\beta$  Pruning

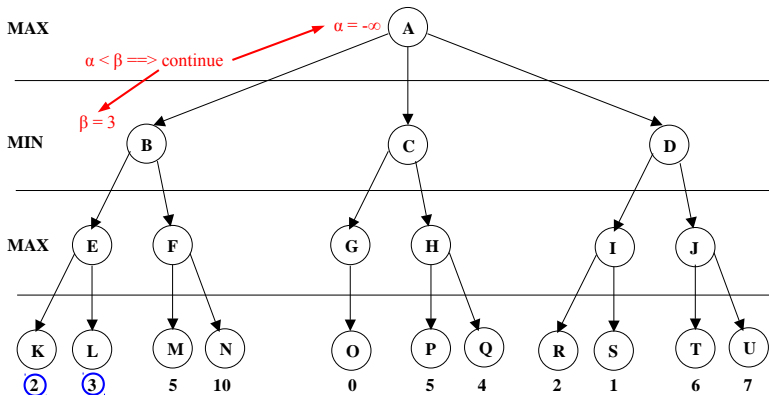

## Requirements & Reading Material

# Adversarial search

## Example: applying $\alpha$ - $\beta$ pruning

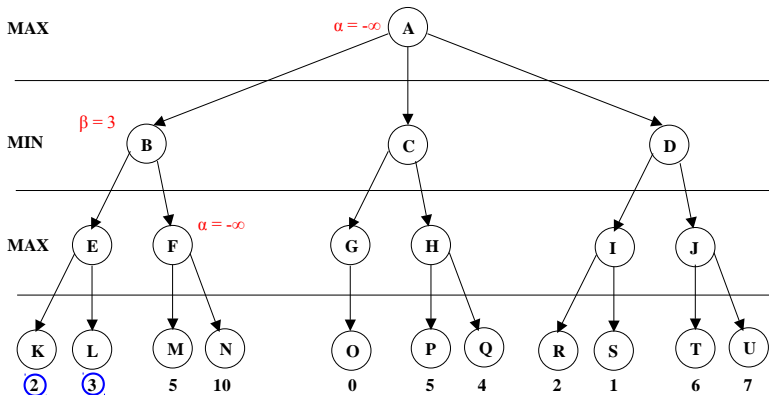

Apply  $\alpha$ - $\beta$  pruning to calculate minimax value for node A.

# Adversarial search

## Example: applying $\alpha$ - $\beta$ pruning

Apply  $\alpha$ - $\beta$  pruning to calculate minimax value for node A.

Apply  $\alpha$ - $\beta$  pruning to calculate minimax value for node A.

# Adversarial search

## $\alpha$ - $\beta$ Pruning

- In the previous example,  $\alpha$ - $\beta$  pruning explored 14 nodes instead of 21 nodes explored by Minimax.

### Outline

#### Adversarial Search

Introduction

Minimax Algorithm

$\alpha$ - $\beta$  Pruning

#### Requirements & Reading Material

# Adversarial search

## $\alpha$ - $\beta$ Pruning

- In the previous example,  $\alpha$ - $\beta$  pruning explored 14 nodes instead of 21 nodes explored by Minimax.
- $\alpha$ - $\beta$  pruning also reached the same decision reached by Minimax.

# Adversarial search

## The $\alpha$ - $\beta$ search Algorithm

**function** ALPHA-BETA-SEARCH( $s$ ) **returns** an action

$v \leftarrow \text{MAX-VALUE}(s, -\infty, +\infty)$

**return** the **action** in ACTIONS( $s$ ) with value  $v$

# Adversarial search

## The $\alpha$ - $\beta$ search Algorithm

**function** ALPHA-BETA-SEARCH( $s$ ) **returns** an action

$v \leftarrow \text{MAX-VALUE}(s, -\infty, +\infty)$

**return** the **action** in ACTIONS( $s$ ) with value  $v$

---

**function** MAX-VALUE( $s, \alpha, \beta$ ) **returns** a utility value

**if** TERMINAL-TEST( $s$ ) **then return** UTILITY( $s$ )

$v \leftarrow -\infty$

**for each**  $a$  **in** ACTIONS( $s$ ) **do**

$v \leftarrow \text{MAX}(v, \text{MIN-VALUE}(\text{RESULT}(s, a), \alpha, \beta))$

$\alpha \leftarrow \text{MAX}(\alpha, v)$

**if**  $\alpha \geq \beta$  **then return**  $\alpha$       /\*  $\beta$ -cutoff \*/

**return**  $v$

### Requirements & Reading Material

## 1 Adversarial Search

## 2 Requirements & Reading Material

# Requirements

## What do I need from you

- When given a certain problem you should be able to:
  - Formulate the game problem.

# Requirements

## What do I need from you

- When given a certain problem you should be able to:
  - Formulate the game problem.
  - Build the game tree up to a given depth.

# Requirements

## What do I need from you

- When given a certain problem you should be able to:
  - Formulate the game problem.
  - Build the game tree up to a given depth.
  - Apply the minimax search algorithm.

# Requirements

## What do I need from you

- When given a certain problem you should be able to:
  - Formulate the game problem.
  - Build the game tree up to a given depth.
  - Apply the minimax search algorithm.
  - Apply the  $\alpha - \beta$  pruning algorithm.

# Requirements

## What do I need from you

- When given a certain problem you should be able to:
  - Formulate the game problem.
  - Build the game tree up to a given depth.
  - Apply the minimax search algorithm.
  - Apply the  $\alpha - \beta$  pruning algorithm.
- Answer descriptive questions.

# Reading Material

## Which parts of the textbook are covered

- Russell-Norvig, Chapters 5:
  - Pages 161 - 170.
